

Extensive capability run

64 distinct pointer stimuli. 48 catalog ids. 3072 cards. Every card now carries hit 0 or 1. The first extensive pass died at root 9 because coordination passed the whole history into an N-cap 8 tournament. The body now tournaments the latest 8 roots.

Figure 1. Hit 1 is a completed body. Hit 0 is the fail-closed set: unknown organ and missing evidence, repeated on every stimulus.

Negatives

Secret scan refuses a PEM header. Mobile bank refuses gpu. Router refuses a third name. Multimodal refuses an executable frame. Tournament refuses a ninth root. Those failures are outside the signed success set.

Clipped-G and training cards were missing hit. They now stamp hit 1 after the trajectory step. A stamped G without a trajectory is still illegal.

What the run did not promote

Tree-wide signoff stays unsigned. Shims stay. deck.py stays. The kernel 64-hex envelope stays. This run is the body, not cutover.

Compile

PYTHONPATH=. python3 -m unittest tests.test_capability_body tests.test_chamber. Then invoke_all across unique VOL-stimuli. Expect no null hit and a 64-hex key id.

Ledger

Final single-stimulus hit count 46 of 48. Key length 64. Branch ai-tree/capability-fill-1.8.0.
