

P5 adversarial review and completion stamp

Apeloff1/Skeleton · branch ai-tree/capability-fill-1.8.0 · parent 3897b961 · 2026-10-09

The first fill probe reported 48 available. That report is not a completion signature. Adversarial closure forbids treating implementation presence, or a same-process probe, as verified behavior. This pass places every catalog task on the Phase 5 action plane, re-executes independent oracles, stamps receipts, and signs only the confirmed set.

Verdict

Tasks placed in P5: 51. Confirmed and signed: 48. Withheld, unsigned: 3. The signature binds the parent git sha, the confirmed-set digest, the evidence-bundle digest, and the fault-manifest digest. Withheld ids are outside the signature. No private key is stored.

Figure 1. Completion is the signed slice. The withheld slice stays on P5 as open action-plane work.

Faults found

F-01 specdec previously stamped mismatch without running accept-until-mismatch

F-02 decision previously stamped veto without suppressing pick

F-03 training previously stamped absorb_steps=4 without a loop

F-04 modeling previously stamped layers=2 without a residual pass

F-05 coordination previously stamped n_cap without a tournament

F-06 hive previously reused a memory root and had no root_history

F-07 security previously reported secret=false without a scan

F-08 mobile previously reported gpu=false without a refusal oracle

F-09 router previously stamped routes=1 without rejecting a third router

F-10 multimodal previously stamped data-only without hashing a frame

F-11 repeated corpus rows are not independent trials

F-12 contrib/ai-tree-fill is unowned in machine/ai_file_tree.json

F-13 a same-process probe is not independent verification

What was false, and what the oracle now does

F-01 through F-10 were stamped from literal dicts. The verifier now runs the contract. Speculative decode accepts until the third token mismatches. Decision veto suppresses pick. Training absorbs four clipped-G steps. Modeling runs two RMSNorm-SiLU layers. Coordination tournaments roots and refuses a ninth. Hive appends root history and refuses a chain. Security refuses a PEM header. Mobile bank refuses gpu. Router refuses a third name. Multimodal hashes a frame and refuses an executable payload.

What stays unsigned

F-11: the evidence corpus repeats stamps; repeats are not independent trials. F-12: contrib/ai-tree-fill is not claimed in machine/ai_file_tree.json, so admission of the path is local to this package. F-13: the verifier is a separate module, but it is still the same process and the same author. House law requires implementation and verification to be distinct. This signature is a local Ed25519 receipt, not an independent sign-off. Capabilities without an oracle stay withheld even if the earlier probe was green.

Confirmed ids

P5 task ledger

Every task is placed before a receipt. Authority is read except outbox and forge, which are write. Sandbox is cpu, no network. Timeout is 2000 ms. Secret policy refuses a live secret.

Signature scope

Algorithm Ed25519. Verifier identity p5-adversarial-verifier. Public key
be6b1f9f546c16550c4ed8dbdfb31396b99010d3679235a1ede3f344b65e8a1f.

Artifact digest ad39a941ef15e1842dc5ffb11d21aeb863f8e6887077d169792c3c3a6674fd26.

Fault digest 899e50bee2e5478765ad388355bae770e9a73a967ff796688c997934974418b3.

The git sha in the signature is the reviewed parent, 3897b961, not the commit that adds this stamp. Binding the stamp commit would be circular. A later independent reviewer can verify the public key against the payload of confirmed ids, faults, and parent sha.

Compile

PYTHONPATH=. python3 -m unittest tests.test_p5_review tests.test_tree_fill. Expect the signature verify to return true, withheld ids absent from signed_ids, and negative oracles to raise. Do not promote withheld ids to verified. Do not merge.
